Capgemini Morocco

Casablanca

Business Analyst Junior Anglophone

A field-tested bridge between business reality and technical delivery.

Dear Capgemini Morocco Recruitment Team,

A strong Business Analyst does more than document requests. The real value is to make sure the business problem is understood, the technical team can act on it, and the delivered solution can be proven useful. That is already how I work.

As a Supplier Quality Engineer at Magna International, I operate between global suppliers, program milestones, quality evidence and operational risk. I convert fragmented inputs into clear ownership, decision views and follow-up mechanisms. The SQE BI and workflow system I developed traces activity from nomination through Safe Launch and SOP, highlights critical parts and open issues, and triggers notifications before missing baselines or overdue actions become launch risks.

That experience maps naturally to the role you describe: collecting and reformulating business needs, preparing workshops, writing functional requirements and user stories, aligning technical contributors, building test scenarios, supporting UAT and maintaining documentation. My background adds something valuable to those responsibilities: I have been accountable for the operational consequences when information is incomplete, a requirement is misunderstood or an action is not traceable.

Capgemini is especially compelling because it offers the scale to apply this discipline across industries while continuing to grow through structured learning and expert communities. I would bring an industrial engineer's process understanding, a data analyst's evidence discipline and the communication needed for an Anglophone, multicultural delivery environment. I am ready to learn the client's platform and domain quickly; the harder-to-teach foundation - curiosity, structured discovery, stakeholder alignment and outcome-based validation - is already demonstrated in my work.

01 / DISCOVER Turn ambiguity into testable requirements I map workflows, stakeholders, exceptions and acceptance criteria before proposing a solution. At Stellantis, that discipline helped convert a two-day BOM anomaly process into a validated workflow completed in under three minutes.	02 / ALIGN Keep business and technical teams on one evidence chain At Magna, I built an SQE BI and workflow system spanning nomination, Safe Launch and SOP, aligning owners, milestones, PPAP/DVP evidence, risks and automated notifications across international supplier programs.	03 / VALIDATE Prove the solution against operational outcomes My portfolio shows how I work: decision framing, explicit assumptions, traceable data and measurable tests - from forecasting and routing to AI-agent reliability. That same rigor transfers directly to scenarios, UAT and continuous improvement.	
< 3 min validated treatment cycle from a two-day workflow	6 modules SQE control system nomination to SOP	3 systems public portfolio cases with evidence boundaries	C1 English TOEIC 855 international collaboration

I would welcome the opportunity to discuss how this operating mindset could support Capgemini's client teams from discovery through acceptance. The linked portfolio is not a gallery of tools; it is a transparent record of how I frame decisions, build evidence and communicate what can - and cannot - be claimed.

Sincerely,

Rida Melkaoui
